

boost::statechart::
event< EvWaypoint192
< TSource, TOrthogonal > >

```
classDiagram
    class Base["boost::statechart::event< EvWaypoint192< TSource, TOrthogonal > >"]
    class Derived["cl_move_base_z::EvWaypoint192< TSource, TOrthogonal >"]
    Derived --|> Base
```

The diagram shows a base class box at the top with a light gray background and a derived class box at the bottom with a darker gray background. A blue arrow with an open triangular head points from the derived class to the base class. The base class box is divided into three horizontal sections; the top section contains the text 'boost::statechart::event< EvWaypoint192< TSource, TOrthogonal > >', while the other two are empty. The derived class box is divided into three horizontal sections: the top section contains 'cl_move_base_z::EvWaypoint192< TSource, TOrthogonal >', the middle section contains '+ waypointIndex', and the bottom section is empty.

cl_move_base_z::EvWaypoint192
< TSource, TOrthogonal >

+ waypointIndex
