

boost::statechart::
event< EvWaypoint246
< TSource, TOrthogonal > >

```
classDiagram
    class Base["boost::statechart::event< EvWaypoint246< TSource, TOrthogonal > >"]
    class Derived["cl_move_base_z::EvWaypoint246< TSource, TOrthogonal >"]
    Derived --|> Base
```

The diagram illustrates an inheritance relationship. At the bottom is a grey-shaded class box for `cl_move_base_z::EvWaypoint246` with a public attribute `+ waypointIndex`. A blue arrow with an open triangular head points from this class to a white class box above it, representing the base class `boost::statechart::event`. The base class box is divided into three horizontal sections, with the first section containing its name and the other two being empty.

cl_move_base_z::EvWaypoint246
< TSource, TOrthogonal >

+ waypointIndex
