

```
boost::statechart::  
event< EvWaypoint100  
< TSource, TObjectTag > >
```

The diagram shows a base class at the top and a derived class at the bottom. The base class is defined with the namespace boost::statechart and the event type EvWaypoint100, with template parameters TSource and TObjectTag. The derived class is defined in the namespace cl_move_base_z and also uses the event type EvWaypoint100 with the same template parameters. The derived class has a public attribute waypointIndex. A blue arrow with an open triangle head points from the derived class to the base class, indicating inheritance.

```
cl_move_base_z::EvWaypoint100  
  < TSource, TObjectTag >
```

```
+ waypointIndex
```
